

Introduction

What is Exploratory Data Analysis?

Exploratory Data Analysis or (EDA) is understanding the data sets by summarizing their main characteristics often plotting them visually. This step is very important especially when we arrive at modeling the data in order to apply Machine learning. Plotting in EDA consists of Histograms, Box plot, Scatter plot and many more. It often takes much time to explore the data. Through the process of EDA, we can ask to define the problem statement or definition on our data set which is very important.

How to perform Exploratory Data Analysis?

This is one such question that everyone is keen on knowing the answer. Well, the answer is it depends on the data set that you are working. There is no one method or common methods in order to perform EDA, whereas in this tutorial you can understand some common methods and plots that would be used in the EDA process.

I got a very beautiful data-set of cars from Kaggle. To give a piece of brief information about the data set this data contains more of 10, 000 rows and more than 10 columns which contains features of the car such as Engine Fuel Type, Engine Size, HP, Transmission Type, highway MPG, city MPG and many more.

1. Importing the required libraries for EDA

Below are the libraries that are used in order to perform EDA (Exploratory data analysis)

```
In [1]: 1 # Importing Required Libraries
        2
        3 import pandas as pd
        4 import numpy as np
        5 import seaborn as sns # Data Visualisation
        6 import matplotlib.pyplot as plt # Data Visualisation
        7 %matplotlib inline
        8 sns.set(color_codes=True)
```

2. Loading the data into the data frame.

Loading the data into the pandas data frame is certainly one of the most important steps in EDA, as we can see that the value from the data set is comma-separated. So all we have to do is to just read the CSV into a data frame and pandas data frame does the job for us.

```
In [2]: 1 df = pd.read_csv("cars_data.csv")
        2 df.head(5) #to display top 5 rows
```

Out[2]:

	Make	Model	Year	Engine Fuel Type	Engine HP	Engine Cylinders	Transmission Type	Driven_Wheels	Number of Doors	Market Category	Vehicle Size	Vehicle Style	highway MPG	city mpg
0	BMW	Series M	2011	premium unleaded (required)	335.0	6.0	MANUAL	rear wheel drive	2.0	Factory Tuner,Luxury,High- Performance	Compact	Coupe	26	19
1	BMW	Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	2.0	Luxury,Performance	Compact	Convertible	28	19
2	BMW	Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	2.0	Luxury,High- Performance	Compact	Coupe	28	20
3	BMW	Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	2.0	Luxury,Performance	Compact	Coupe	28	18
4	BMW	Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	2.0	Luxury	Compact	Convertible	28	18

In [3]:

```
1 # To display bottom 5 rows
2 df.tail(5)
```

Out[3]:

	Make	Model	Year	Engine Fuel Type	Engine HP	Engine Cylinders	Transmission Type	Driven_Wheels	Number of Doors	Market Category	Vehicle Size	Vehicle Styl
11909	Acura	ZDX	2012	premium unleaded (required)	300.0	6.0	AUTOMATIC	all wheel drive	4.0	Crossover,Hatchback,Luxury	Midsize	4c Hatchbac
11910	Acura	ZDX	2012	premium unleaded (required)	300.0	6.0	AUTOMATIC	all wheel drive	4.0	Crossover,Hatchback,Luxury	Midsize	4c Hatchbac
11911	Acura	ZDX	2012	premium unleaded (required)	300.0	6.0	AUTOMATIC	all wheel drive	4.0	Crossover,Hatchback,Luxury	Midsize	4c Hatchbac
11912	Acura	ZDX	2013	premium unleaded (recommended)	300.0	6.0	AUTOMATIC	all wheel drive	4.0	Crossover,Hatchback,Luxury	Midsize	4c Hatchbac
11913	Lincoln	Zephyr	2006	regular unleaded	221.0	6.0	AUTOMATIC	front wheel drive	4.0	Luxury	Midsize	Seda

3. Checking the types of data

Here we check for the datatypes because sometimes the MSRP or the price of the car would be stored as a string or object, if in that case, we have to convert that string to the integer data only then we can plot the data via a graph. Here, in this case, the data is already in integer format so nothing to worry.

```
In [4]: 1 # checking data types
        2 df.dtypes
```

```
Out[4]: Make                object
Model                  object
Year                   int64
Engine Fuel Type       object
Engine HP              float64
Engine Cylinders       float64
Transmission Type      object
Driven_Wheels          object
Number of Doors        float64
Market Category        object
Vehicle Size           object
Vehicle Style          object
highway MPG            int64
city mpg               int64
Popularity             int64
MSRP                   int64
dtype: object
```

4. Dropping irrelevant columns

This step is certainly needed in every EDA because sometimes there would be many columns that we never use in such cases dropping is the only solution. In this case, the columns such as Market Category, Number of doors, Vehicle Size doesn't make any sense to me so I just dropped for this instance.

In [5]:

```

1 # Dropping unnecessary columns
2 df = df.drop(["Market Category", "Number of Doors", "Vehicle Size"], axis=1)
3 df.head()

```

Out[5]:

	Make	Model	Year	Engine Fuel Type	Engine HP	Engine Cylinders	Transmission Type	Driven_Wheels	Vehicle Style	highway MPG	city mpg	Popularity	MSRP
0	BMW	Series M	2011	premium unleaded (required)	335.0	6.0	MANUAL	rear wheel drive	Coupe	26	19	3916	46135
1	BMW	Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	Convertible	28	19	3916	40650
2	BMW	Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	Coupe	28	20	3916	36350
3	BMW	Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	Coupe	28	18	3916	29450
4	BMW	Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	Convertible	28	18	3916	34500

5. Renaming the columns

In this instance, most of the column names are very confusing to read, so I just tweaked their column names. This is a good approach it improves the readability of the data set.

In [6]:

```
ssion", "Driven_Wheels": "Drive Mode", "highway MPG": "MPG-H", "city mpg": "MPG-C", "MSRP": "Price", "Engine Fuel Type": "Fuel"]})
```

Out[6]:

	Make	Model	Year	Fuel	HP	Engine Cylinders	Transmission	Drive Mode	Vehicle Style	MPG- H	MPG- C	Popularity	Price
0	BMW	1 Series M	2011	premium unleaded (required)	335.0	6.0	MANUAL	rear wheel drive	Coupe	26	19	3916	46135
1	BMW	1 Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	Convertible	28	19	3916	40650
2	BMW	1 Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	Coupe	28	20	3916	36350
3	BMW	1 Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	Coupe	28	18	3916	29450
4	BMW	1 Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	Convertible	28	18	3916	34500

6. Dropping the duplicate rows

This is often a handy thing to do because a huge data set as in this case contains more than 10, 000 rows often have some duplicate data which might be disturbing, so here I remove all the duplicate value from the data-set. For example prior to removing I had 11914 rows of data but after removing the duplicates 10925 data meaning that I had 989 of duplicate data.

In [7]:

```
1 # total number of rows and columns
2 df.shape
```

Out[7]: (11914, 13)

```
In [8]: 1 # checking duplicate entries
        2
        3 duplicate_df = df[df.duplicated()]
        4 print("Number of Duplicate rows : ",duplicate_df.shape)
```

Number of Duplicate rows : (732, 13)

```
In [9]: 1 # use count the number of rows before removing the data
        2 df.count()
```

```
Out[9]: Make                11914
        Model              11914
        Year               11914
        Fuel               11911
        HP                 11845
        Engine Cylinders   11884
        Transmission      11914
        Drive Mode        11914
        Vehicle Style     11914
        MPG-H             11914
        MPG-C             11914
        Popularity        11914
        Price             11914
        dtype: int64
```

So seen above there are 11914 rows and we are removing 989 rows of duplicate data.

```
In [10]: 1 # Dropping the duplicates
          2 df = df.drop_duplicates()
          3 df.head()
```

Out[10]:

	Make	Model	Year	Fuel	HP	Engine Cylinders	Transmission	Drive Mode	Vehicle Style	MPG- H	MPG- C	Popularity	Price
0	BMW	1 Series M	2011	premium unleaded (required)	335.0	6.0	MANUAL	rear wheel drive	Coupe	26	19	3916	46135
1	BMW	1 Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	Convertible	28	19	3916	40650
2	BMW	1 Series	2011	premium unleaded (required)	300.0	6.0	MANUAL	rear wheel drive	Coupe	28	20	3916	36350
3	BMW	1 Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	Coupe	28	18	3916	29450
4	BMW	1 Series	2011	premium unleaded (required)	230.0	6.0	MANUAL	rear wheel drive	Convertible	28	18	3916	34500

```
In [11]: 1 # counting the number of rows after removing duplicates
        2 df.count()
```

```
Out[11]: Make                11182
        Model                11182
        Year                11182
        Fuel                11179
        HP                  11113
        Engine Cylinders    11152
        Transmission        11182
        Drive Mode          11182
        Vehicle Style       11182
        MPG-H               11182
        MPG-C               11182
        Popularity          11182
        Price               11182
        dtype: int64
```

7. Dropping the missing or null values.

This is mostly similar to the previous step but in here all the missing values are detected and are dropped later. Now, this is not a good approach to do so, because many people just replace the missing values with the mean or the average of that column, but in this case, I just dropped that missing values. This is because there is nearly 100 missing value compared to 10, 000 values this is a small number and this is negligible so I just dropped those values.

```
In [12]: 1 #finding the null values
          2
          3 print(df.isnull().sum())
```

```
Make          0
Model         0
Year          0
Fuel          3
HP           69
Engine Cylinders 30
Transmission  0
Drive Mode    0
Vehicle Style 0
MPG-H         0
MPG-C         0
Popularity    0
Price         0
dtype: int64
```

This is the reason in the above step while counting both Cylinders and Horsepower (HP) had 10856 and 10895 over 10925 rows.

```
In [13]: 1 # dropping the missing values
          2
          3 df= df.dropna()
          4 df.count()
```

```
Out[13]: Make                11081
          Model              11081
          Year               11081
          Fuel               11081
          HP                 11081
          Engine Cylinders   11081
          Transmission       11081
          Drive Mode         11081
          Vehicle Style      11081
          MPG-H              11081
          MPG-C              11081
          Popularity         11081
          Price              11081
          dtype: int64
```

Now we have removed all the rows which contain the Null or N/A values (Cylinders and Horsepower (HP)).

```
In [14]: 1 # after dropping the null values
          2 print(df.isnull().sum())
```

```
Make          0
Model         0
Year          0
Fuel          0
HP            0
Engine Cylinders 0
Transmission  0
Drive Mode    0
Vehicle Style 0
MPG-H         0
MPG-C         0
Popularity    0
Price         0
dtype: int64
```

8. Detecting Outliers

An outlier is a point or set of points that are different from other points. Sometimes they can be very high or very low. It's often a good idea to detect and remove the outliers. Because outliers are one of the primary reasons for resulting in a less accurate model. Hence it's a good idea to remove them. The outlier detection and removing that I am going to perform is called IQR score technique. Often outliers can be seen with visualizations using a box plot. Shown below are the box plot of MSRP, Cylinders, Horsepower and EngineSize. Herein all the plots, you can find some points are outside the box they are none other than outliers. The technique of finding and removing outlier that I am performing in this assignment is taken help of a tutorial from towards data science.

```
In [15]: 1 sns.boxplot(x=df["Price"])
```

```
Out[15]: <matplotlib.axes._subplots.AxesSubplot at 0x2b2697bca30>
```

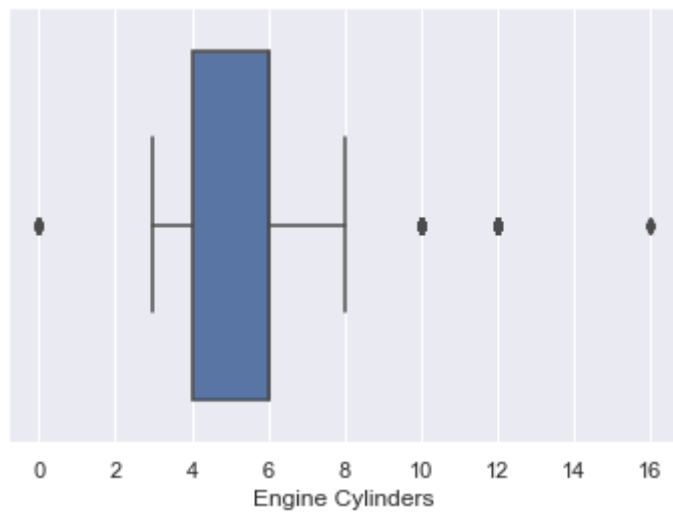

```
In [16]: 1 sns.boxplot(x=df["HP"])
```

```
Out[16]: <matplotlib.axes._subplots.AxesSubplot at 0x2b269f0baf0>
```

```
In [17]: 1 sns.boxplot(x=df["Engine Cylinders"])
```

```
Out[17]: <matplotlib.axes._subplots.AxesSubplot at 0x2b269f4b130>
```

```
In [18]: 1 Q1 = df.quantile(0.25)
          2 Q3 = df.quantile(0.75)
          3
          4 IQR = Q3 - Q1
          5 print(IQR)
```

```
Year          9.0
HP           132.0
Engine Cylinders  2.0
MPG-H         8.0
MPG-C         6.0
Popularity    1460.0
Price        21460.0
dtype: float64
```

```
In [19]: 1 df = df[~((df<(Q1-1.5*IQR))|(df > (Q3+1.5*IQR))).any(axis=1)]
```

```
In [20]: 1 df.shape
```

```
Out[20]: (8601, 13)
```

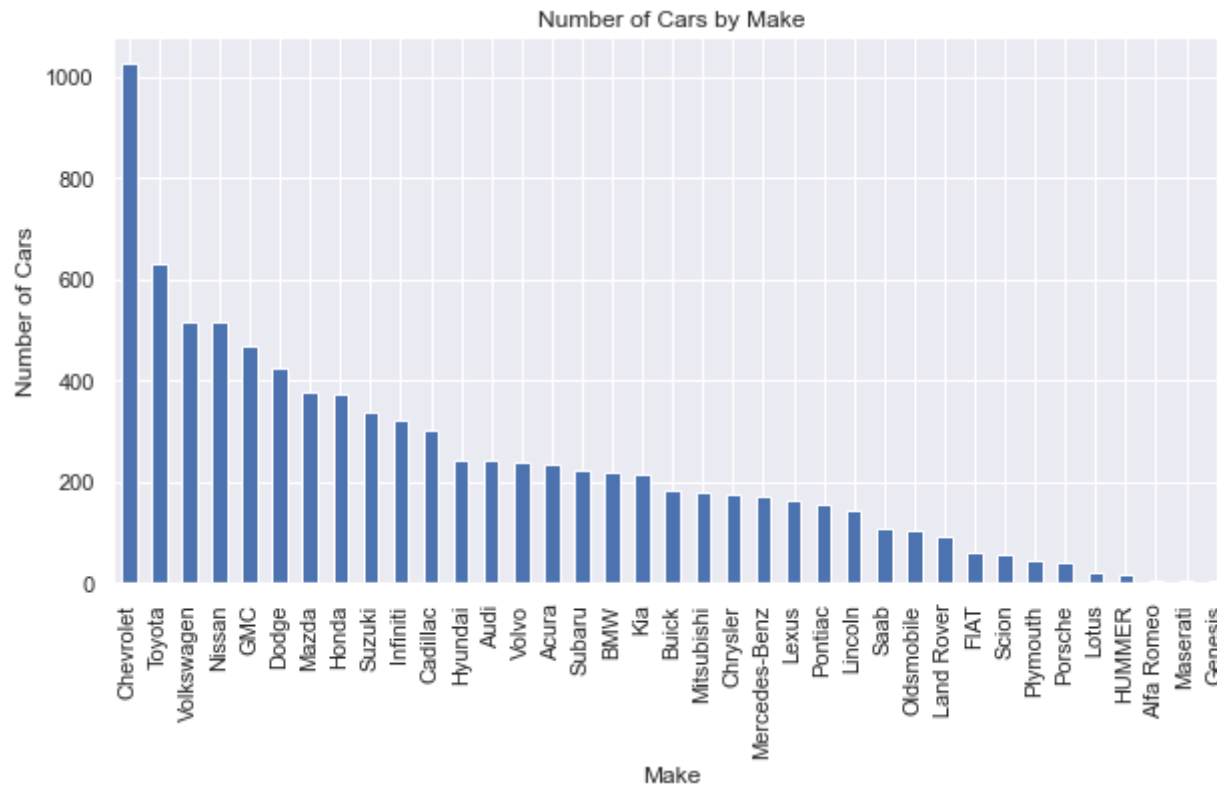

As seen above there were around 1600 rows were outliers. But you cannot completely remove the outliers because even after you use the above technique there maybe 1–2 outlier unremoved but that ok because there were more than 100 outliers. Something is better than nothing.

9. Data Visualization

Histogram

Histogram refers to the frequency of occurrence of variables in an interval. In this case, there are mainly 10 different types of car manufacturing companies, but it is often important to know who has the most number of cars. To do this histogram is one of the trivial solutions which lets us know the total number of car manufactured by a different company.

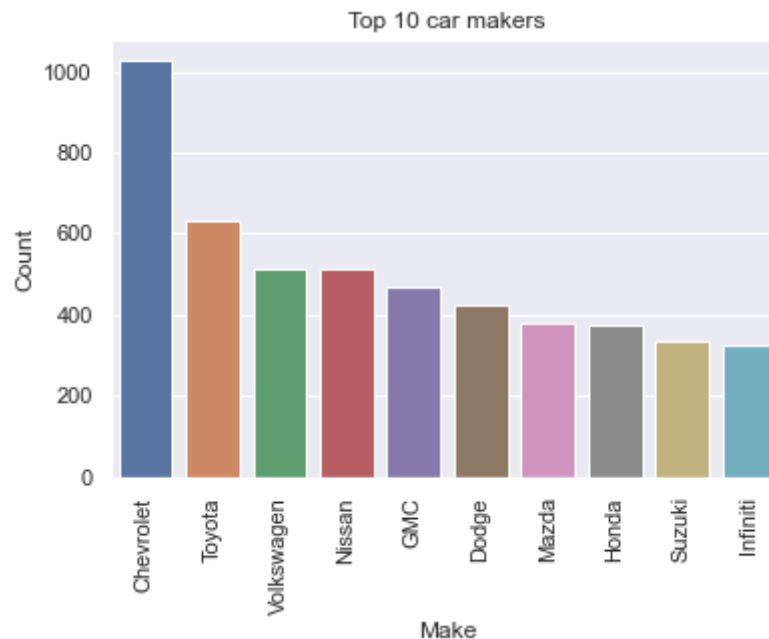

```
In [21]: 1 # histogram plotting
2
3 df.Make.value_counts().nlargest(40).plot(kind='bar',figsize=(10,5))
4 plt.title("Number of Cars by Make")
5 plt.ylabel("Number of Cars")
6 plt.xlabel("Make");
```

Hence the above are some of the steps involved in Exploratory data analysis, these are some general steps that you must follow in order to perform EDA.

Top 10 manufacturers (number of cars produced)

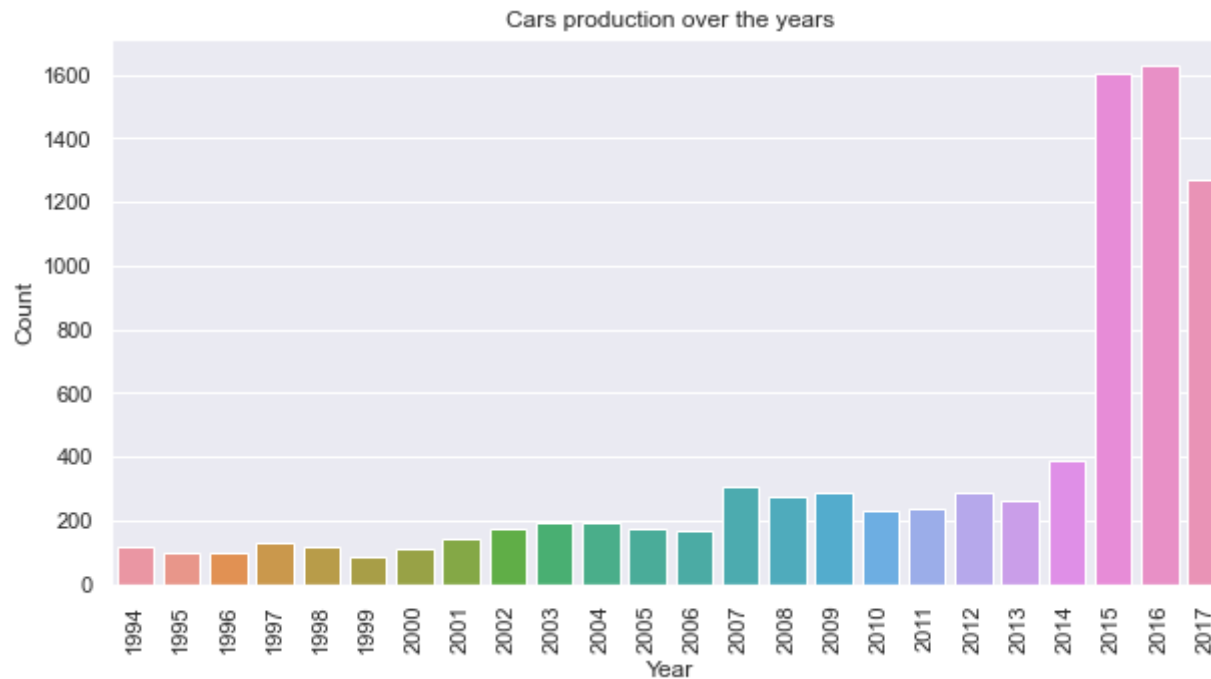

```
In [22]: 1 plt.figure(figsize=(7,3))
2 top_ten = df.groupby("Make").size().sort_values(ascending=False).head(10)
3 top_ten_df = pd.DataFrame(top_ten.reset_index(name="Count"))
4 plt.title('Top 10 car makers')
5 plt.ylabel('Number of cars')
6 plt.xticks(rotation=90)
7 sns.barplot(x='Make', y='Count', data=top_ten_df);
```

From the above bar plot we can infer that most of the people buy cars from Chevrolet, Ford, Toyota and Volkswagen as they produce more economical cars which can be afforded by more people.

Cars produced over the years

```
In [23]: 1 plt.figure(figsize=(10,5))
2 cars_prod_df = pd.DataFrame(
3     df.groupby("Year")
4     .size()
5     .reset_index(name="Count")
6 )
7 plt.title('Cars production over the years')
8 plt.xticks(rotation=90)
9 sns.barplot(x="Year", y="Count", data=cars_prod_df);
```

From the above chart we can see that cars production has increased over the years. In year 2017 though, we see a dip in the number of cars produced. It could also be because of incomplete data for 2017.

Fuel types per Year

```
In [24]: 1 plt.figure(figsize=(10,5))
2 fueldf = df[(df['Year'] > 2007) & (df['Year'] < 2017)].copy()
3 ax = sns.countplot(x="Year", hue="Fuel", data=fueldf)
4 #plt.setp(ax.get_legend().get_title(), fontsize='32')
5 #plt.setp(ax.get_legend().get_texts(), fontsize='28')
6 plt.show()
```

Scatterplot

We generally use scatter plots to find the correlation between two variables. Here the scatter plots are plotted between Horsepower and Price and we can see the plot below. With the plot given below, we can easily draw a trend line. These features provide a good scattering of points.

In [25]:

```
1 # Plotting a scatter plot
2 fig, ax = plt.subplots(figsize=(10,6))
3 ax.scatter(df['HP'], df['Price'])
4 ax.set_xlabel('HP')
5 ax.set_ylabel('Price')
6 plt.show()
```

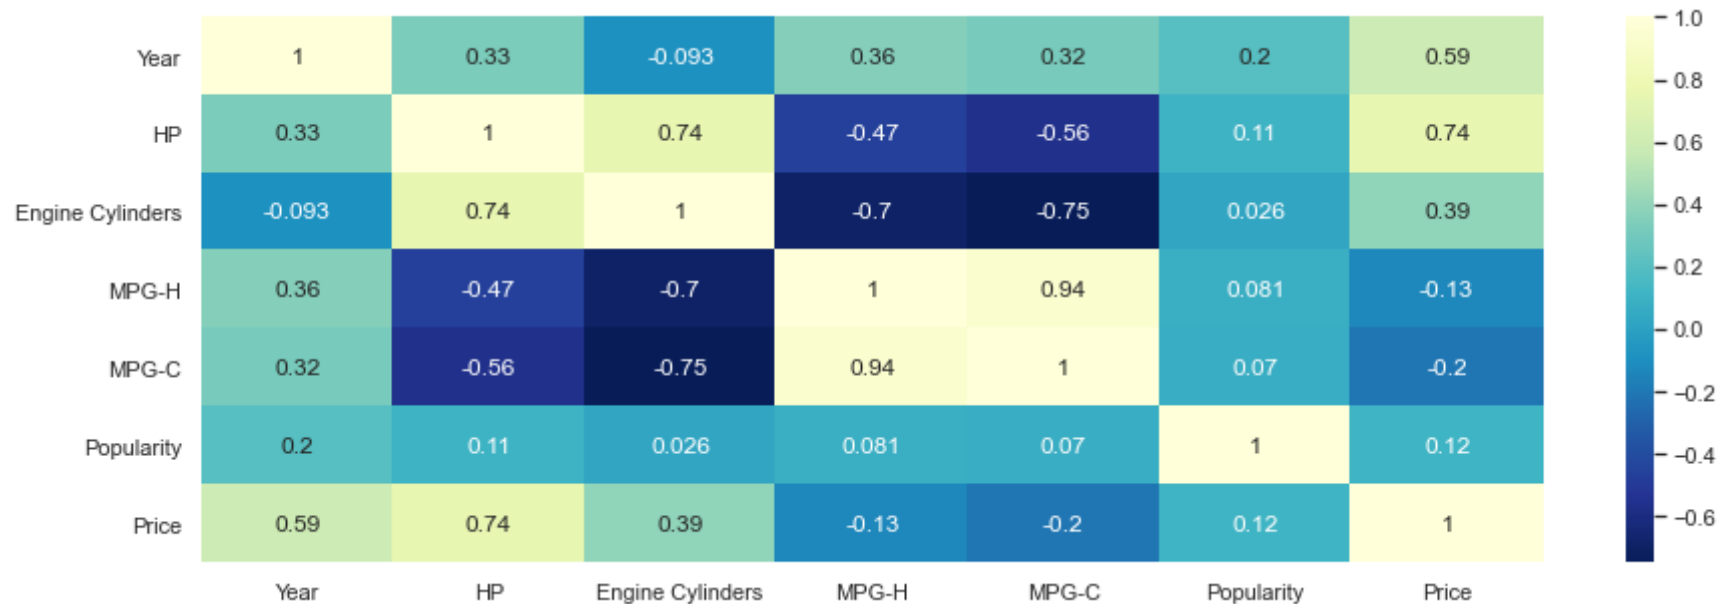

Heat Maps

Heat Maps is a type of plot which is necessary when we need to find the dependent variables. One of the best way to find the relationship between the features can be done using heat maps. In the below heat map we know that the price feature depends mainly on the Engine Size, Horsepower, and Cylinders.

```
In [26]: 1 # find relation between the variables
2 plt.figure(figsize=(15,5))
3 c = df.corr()
4 sns.heatmap(c,cmap="YlGnBu_r",annot=True)
5 c
```

Out[26]:

	Year	HP	Engine Cylinders	MPG-H	MPG-C	Popularity	Price
Year	1.000000	0.330139	-0.092862	0.358082	0.321957	0.204183	0.590127
HP	0.330139	1.000000	0.741905	-0.466543	-0.564547	0.105459	0.743740
Engine Cylinders	-0.092862	0.741905	1.000000	-0.697714	-0.750664	0.026059	0.394267
MPG-H	0.358082	-0.466543	-0.697714	1.000000	0.937859	0.080608	-0.130348
MPG-C	0.321957	-0.564547	-0.750664	0.937859	1.000000	0.070032	-0.204918
Popularity	0.204183	0.105459	0.026059	0.080608	0.070032	1.000000	0.116246
Price	0.590127	0.743740	0.394267	-0.130348	-0.204918	0.116246	1.000000

Asking and Answering Questions

Q1: Has use of diesel cars increased or decreased over the years?

```
In [27]: 1 plt.figure(figsize=(10,5))
2 diesel_df = df[df['Fuel'].str.contains('diesel')].copy()
3 ax = sns.countplot(x="Year", hue="Fuel", data=diesel_df)
4 plt.show()
```

Use of diesel cars increased steadily from 2010 to 2015. Thereafter, the usage has gone down drastically which could be attributed to the stricter pollution laws coming in.

Q2: Has production of SUVs increased over the years?

```
In [28]: 1 vs_df = df[df['Vehicle Style'].str.contains('SUV')].groupby(['Year', 'Vehicle Style']).size().reset_index(name="Count")
2 df_pivot = pd.pivot_table(
3     vs_df,
4     values="Count",
5     index="Year",
6     columns="Vehicle Style",
7     aggfunc=np.mean
8 )
9
10 df_pivot.plot(kind="bar", figsize=(20, 7));
```

From the graph we can clearly see that SUV production has gone up significantly as compared to previous decades.

Q3: Which brand is least popular and which one is most popular?

In [29]:

```
1 # Popular Cars
2 popcars_df = df[['Make', 'Popularity']].sort_values('Popularity')
3 popcars_df = popcars_df.drop_duplicates()
4 popcars_df.plot(kind="bar", x="Make", figsize=(20,10));
```

Spyker is least popular and Ford is most popular brand.

Inferences and Conclusion

- Our analysis shows that Price of the car positively correlates with higher Engine specifications like more horsepower.
- Using the above conclusion we can also form a linear relationship between the variables to predict price of the car based on engine specifications.
- The use of E85 fuel has gone up over the years as green initiatives have picked up the pace. More people prefer greener alternatives now.
- Production of SUVs increased rapidly in last few years.
- Ford is the most popular brand in the world but Chevrolet produced most cars.
